

Slash commands

Home Church. Six commands, run them in Claude Code. Everything except the last one publishes straight to Supabase, which means it reaches every phone the next time the app opens. No build, no merge, no App Store.

PUBLISHING CONTENT

/new-guide

Turns a sermon PDF into a full small group guide and publishes it.

WRITES TO **guides**, plus **series** if a new series is starting

GIVE IT Attach the sermon PDF. It will stop and ask if there isn't one.

The longest one by far. It follows NEW_GUIDE_PROCESS.md for the writing, the section quotas, and the voice rules, and shows you the draft before anything is published.

/new-podcast

Attaches the week's episode to its sermon and puts the real title on the message.

WRITES TO **podcasts**

GIVE IT Nothing, if it can reach Spotify. Otherwise the episode title, date, link, and description.

The message name lives here and nowhere else. The guide inherits it, which is why renaming is one field and not two.

/new-event

Adds an event to the Connect tab calendar.

WRITES TO **events**

GIVE IT What, when, where. It asks for anything missing in one message.

Times are converted from New Orleans local to UTC for you. Never do that arithmetic by hand, the offset changes twice a year.

/new-announcement

Publishes the One thing card at the top of Home.

WRITES TO **announcements**

GIVE IT The thing and its date, one or two sentences about it, and the day it should stop showing.

Give it an end date. The card takes itself down on that day and nobody has to remember to remove it. Home shows one card, so priority breaks the tie if two are live.

FIXING AND EXTENDING

/edit-content

Fixes anything already published. Describe the change the way you would say it out loud.

WRITES TO patches whichever row you mean

GIVE IT Plain language. "Fix the typo in this week's guide, their should be there."

Shows current versus proposed and writes only after you say yes. Unpublishes rather than deletes, so a mistake is reversible.

/new-content-type

Scaffolds a whole new kind of content: the table, the app wiring, and its own slash command.

WRITES TO **code**, not content

GIVE IT The name of the thing. "/new-content-type staff bios"

The one command here that is a code change, so it needs a commit and a merge to main. Adding a new kind of content is a code change. Adding content is not.

No command needed

Six tables have no command of their own. Just ask for the change in plain language and it gets made: **the reading plan, groups, serve teams, next steps, church details**, and the **podcast show card**.

"Move the reading plan to week 10, 2 Samuel 15."

"Lakeview Thursday is full now."

"Service times are changing to 9 and 11."

Worth knowing

Nothing publishes without your yes. Every command shows you the finished thing first and waits.

Ids are permanent. Phones remember dismissed cards and saved leader notes by id, so renaming one makes a dismissed card reappear. New thing, new id.

Unpublish, do not delete. Setting published to false is reversible and takes it off phones just as fast.

Dates retire things for you. An announcement with an end date takes itself down. Use it every time.

Zero em-dashes, anywhere, in anything published. Commas instead.

Two exceptions to deleting: the church details and the podcast show card are edited, never emptied. Four screens read them without checking.
